Summary

Fullstack Developer with nearly 5 years of experience building and maintaining commercial web applications for European clients. I own work end to end: talk through the requirement with the client, ship it, and stay with it in production. Ruby on Rails, PHP, React, and Node.

Experience

Software Developer | Toughbyte | Jan 2022 to present

Web applications for European clients, from requirements through to a live system.

Applicant Tracking System (ATS)

- Developed and maintained hiring software, including a public ATS: candidate pipelines, roles, and communications (Ruby on Rails, Hotwire).
- Turned feedback from the recruiting team into features in the running product, not a separate spec.
- Owned new modules from the first conversation through deploy on Heroku or Dokku and monitoring with Sentry.

Logistics and trade

- Engineered and supported a commercial platform for a European logistics client: customers, stock, and money in a live system (PHP, React).
- Translated operational rules from the people who run the business into code that holds in production.
- Stayed with the product after release: fixes, follow-up requests, and the next change they could already use.

Other client work

- Primary developer on further long-term client products. Same ownership: consultation, implementation, deploy, support.
- Deployed with Heroku, Dokku, Docker, and self-hosted setups. AWS Lambda where the work is functions rather than a long-running process.
- CI with GitHub Actions so tests and deploys are not a manual ritual.

Skills

Languages: Ruby, PHP, JavaScript, TypeScript, SQL, Node

Frameworks: Ruby on Rails, React, Hotwire, Stimulus, Turbo

Databases: PostgreSQL, MySQL, MongoDB

Infrastructure: Docker, AWS (S3, Lambda), Heroku, Dokku, self-hosted

Tools: Sentry, Git, GitHub Actions

Spoken languages

English: Professional working proficiency

Russian: Native
